Digital solutions of DGOffice

With just a few simple steps, DGOffice enables you to stay on top of the transportation, production, storage, and trade of any class of dangerous goods or chemicals in a safe and compliant manner. Online software, web services and integration are the most common sources of solutions. These are continuously developed and updated by our internal design & development team, working together with internal DG Specialists and customers.

Software

DGOffice.net is the online software solution for your dangerous goods activities and chemical management. It is designed to be accessed wherever needed, allowing users to create documents and labels with minimal effort and time. It has a modular design that makes it easy to adapt languages, regulations and more, from transport & logistics to production, storage & chemical management, and from safety to compliance.

Web services

Web services is a solution for those who want to work in their own system while having the latest dangerous goods information available. DGOffice web services are used to interface with the existing back-office system and provide relevant information. Documents, data, calculations, classifications, validation and more can be obtained directly from DGOffice.net, and are presented in your system.

DGOffice web services provide a variety of web services that enable communication with a system, such as ERP, WMS, TMS, CMR or own-defined solutions.

E-freight

DGOffice e-freight module enables digital data exchange to improve safety and compliance, work smarter and smoothen processes, and reduce footprints.

DGOffice.net provides validated shipment information, which can be sent or exported as PDF, DGXML, IATA XML or FDD. These options are made available by default as extension to the transport modules. The shipment information is then distributed to other parties, such as Lufthansa Cargo, without the need to manually enter or copy data.

Digital standards

Digital logistics is the exchange of shipping data between systems, allowing for safe, secure and easy transactions. Standards must be created to ensure success.

The IATA guide is a widely available standard for eDGD implementation, covering requirements and process-flow for all air cargo users. Work with their data format, IATA XML, via our modules for air transport and e-freight.

Our own DGXML standard is another publicly available version which can be used for any mode of transport.

Publications

Access dangerous goods regulations in online book format through our online software solution DGOffice.net. Create a library or book shelf with regulations, manuals, instructions, etc. for access to the latest information.

Other solutions

Visit our website or get in touch with our team for more information.
